## Finalyse SAL bacteriophage effectively reduced *Salmonella* in ground turkey as part of a multi-hurdle food safety approach in a commercial validation.

### STUDY OVERVIEW

A long-term paired validation study<sup>1</sup> was conducted to determine the antimicrobial efficacy of treating drums with Finalyse™ SAL following a PAA dip for reducing *Salmonella* prevalence in ground turkey.

Batches of bone-in drums from the same flock were dipped in 500ppm PAA (30 sec) and then separated into a control batch (PAA only) and a treated batch that was dipped in a 10<sup>7</sup> pfu/mL Finalyse SAL solution (30 sec). Both control and treated drums were shipped to the grinding plant and ground separately (~ 12–24 hr post-treatment) prior to *Salmonella* sampling and analysis.

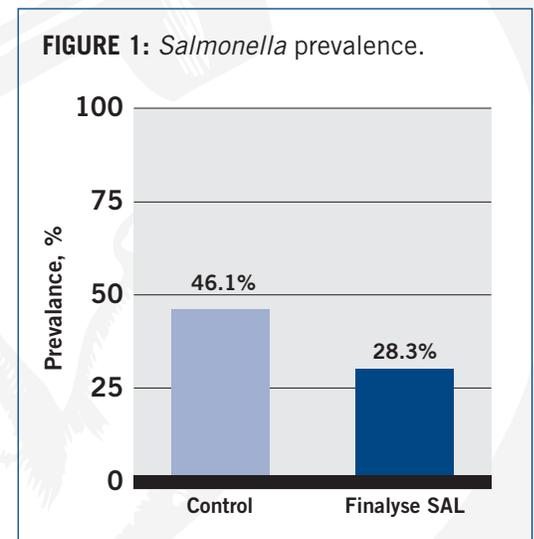

Over a one-month period, this process was repeated for a total of 18 batches and samples were collected from 10 random trays for each of the treatment groups within a batch (n=360).

The efficacy of Finalyse SAL for reducing the prevalence of *Salmonella* was evaluated using a mixed effects probit model to test for a significant impact on prevalence. The large amount of day-to-day variation in the positive rates for the two treatment groups necessitated a more advanced model for isolating the expected impact of Finalyse SAL on prevalence rates.

### RESULTS

Treating drums with Finalyse SAL resulted in a significantly ( $P<0.01$ ) lower *Salmonella* prevalence (38.6%) in ground turkey when compared to the control (46.1% vs 28.3%) (Fig. 1).

In addition, this model can be used to estimate the expected changes in *Salmonella* prevalence in ground turkey (Table 1) based on the prevalence rate for ground samples with PAA only (Control).

| <b>TABLE 1</b>             | Expected prevalence and difference based on control prevalence (%). |                      |                      |                      |
|----------------------------|---|----------------------|----------------------|----------------------|
| Control (PAA only)         | 10.0  | 25.0                 | 50.0                 | 75.0                 |
| Finalyse SAL after PAA*    | 1.1   | 4.6                  | 15.6                 | 36.8                 |
| <b>Expected Difference</b> | <b>8.9</b>  | <b>20.4</b>          | <b>34.4</b>          | <b>38.2</b>          |
| <b>95% CI</b>              | <b>(7.0 – 9.7)</b>  | <b>(14.9 – 23.2)</b> | <b>(22.7 – 42.2)</b> | <b>(22.2 – 52.3)</b> |

\*Model derived estimates.

## CONCLUSIONS

- Finalyse™ SAL, when used as a dip for bone-in drums, significantly reduced *Salmonella* prevalence in ground turkey samples.
- Finalyse SAL can be an effective antimicrobial intervention in reducing *Salmonella* in ground turkey when used as part of a multi-hurdle, multi-technology food safety approach.
